Decrement BPM

Decrement 1 BPM vial Midi clock

When this Midi type is assigned to a button it will decrement the Midi clock by one BPM each time it is pressed, you can also hold the button down to fast scroll.

* Please note that this feature will require the use of another pedals screen in order to see the BPM scrolling. Also each pedal manufacturer updates their Midi clock differently and the responsiveness/reporting of their screen will vary from manufacturer to manufacturer.

** MIDI Clock operates on a much higher voltage than traditional guitar signals, when sending Midi Clock you may experience a slight ticking noise in your signal chain. To reduce this noise make sure your MCX is on an isolated power supply. If you want to stop the ticking noise all together, you should assign a button to stop the Midi clock after your pedals have sync'd, or enable the "auto stop clock" feature in the global settings.
