# Getting Started

Instructions for connecting the Trio to the Unity6

- Connections and Daisy Chaining the Trio

# Connections and Daisy Chaining the Trio

The Trio does not require a power connection, you will only need one patch cable for the Trio. Simply use a standard TRS patch cable, plug one end into the input jack on the Trio and the other end into either UniPort 1 or UniPort 2 of the Unity6.
*UniPorts 3 & 4 will not work with the Trio, make sure you only plug into UniPort 1 or 2.

Up to 2 Trio’s can be daisy chained together per UniPort for more switches and control over your Unity6. Use a standard TRS patch cable and plug one end into the Thru jack of the first Trio (the Trio that is connected to the Unity6) and the other end into the Input jack on the second Trio.

Daisy chaining two Trio’s together per UniPort will give you a total of 12 additional switches that can be added to the Unity6.
