

Delay (ms)

Used to delay the MIDI stack (any of the 32 messages stored in a preset) for a predefined time.

This can be useful when you experience an external MIDI pedal that needs some time to process several MIDI messages. Inserting a small delay in between several messages will allow some time for that pedal to process each message individually.

Select the Value and the Multiplier (1,000 milliseconds = 1 second).

The range for this message type is 1ms to 10 seconds.
