

Expression to Volume

The Unity6 now has the ability to use a single expression pedal to control/send MIDI expression messages AND it can be used as a standard volume pedal. This can be saved on a per bank basis meaning one bank it can be a volume pedal and then jump to a different bank and use it as an expression pedal to control parameters like Wah, Phaser, Decay Time, Repeats, etc.

Clicking on either checkbox will make the expression pedal as a volume pedal and it will disable the Exp Pedal control for that Bank.

Name: Bank #1

Bank #: 1 -  +
